Level 2 (Measured) card. Level 1, Certified (an independent proof recheck), is not built yet: this is not a certificate.

Run conditions. Run on a dedicated build host (20 cores), load average 1.29 at the start of the run; comparators built on that same host in the same run.

Throughput MB/s, the floored corpus `857fc854`: simdjson 1559.6, vbm-json 363.1, serde_json 162.4, python-json 103. Gap to simdjson: 4.3x (non-scalar, not floored); best scalar serde_json is 0.45x faster (floor: within 2x). Pinned: python-json 3.14.8, serde_json 1.0.150, simdjson 5.0.5.

Hand-written cases (0). Drivers, 0 cases: 8 files.

Warm run (what a landing costs, floor under 60 s): the fast gate after a typical change, on the cache the cold run left; skipped 13 of 24 gates by design: C ABI test, wasm32 build test, freestanding native test, language bindings test, workflow lint, protected-set gate, lander, commit-on-main guard, parallel test runner, delta test selection, crash-record check, gate-diff judge, relabel-attack suite.

Cold run (what an outside contributor pays, ceiling 600 s, shown beside the warm run): 2 CPUs, 4 GB cap, a fresh clone with no cache.
